TITLE:

Electronic Automatic Cutout for Machines for the Testing of Contact Resistance

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 9, pp 1136-1137 (USSR)

ABSTRACT:

So far, in contact resistance tests, the fatigue crumbling of pittings was determined on the basis of the noise change of the testing machine or by a visual examination of the pitting, and then the electromotor was switched off. An automatic control of the cutout of the machine at the instant of the crumbling of the pitting was developed. For this purpose, an electronic automatic cutout was designed. The basic scheme of the latter was suggested by the Candidate of Technical Sciences I. M. Sakhon'ko, while the scheme of the necessary amplifier was worked out by Engineer V. I. Shchipunov and D. Ya. Pavlov. The mode of operation of the cutout is based on the conversion of the mechanical vibration arising from the destruction of the pitting into electric signals which act on an electronic scheme and thus stop the electromotor by means of a relay. research institutes and design and planning organizations.

COVERAGE: The collection contains papers presented at the Third Scientific Technical Conference held in Kiyev in September 1957 on problems of increasing the wear resistance and extending the service life of machines. The conference was sponsored by the Institut stroitel'noy mekhaniki AN UkrSSR (Institute of Structural Mechanics of the Academy of Sciences Ukrainian SSR), and by the Kiyevskaya oblastnaya organizatsiya nauchno-tekhnicheskogo obshchestva mashinostroitel'noy promyshlennosti (Kiyev Regional Organization of the Scientific Technical Society of the Machine-Building Industry). Papers presented at the conference were published in two volumes. The first volume contains papers presented at the plenary session and at the conference section on "Wear of Metals and Methods of Investigation". The second volume contains papers presented at the conference section on "Methods of Extending the Service Life of Machine Parts". These papers discuss mechanical, chemical, and electrolytic methods of increasing the durability (wear resistance and fatigue strength).

TITLE: The effect of mechanical operations on the state of the outer layers of antifriction bearings

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 15, 1961, 19, abstract 15B111 (V sb. "Povysheniye iznosostoykosti i sroka sluzhby mashin. v. 1". Kiyev, AN UkrSSR, 1960, 61-76)

TEXT: The authors present the results of comprehensive investigations of the effect of mechanical working on the physical state of the outer layers of the antifriction surfaces of antifriction bearing races. Four groups of specimens of bearing races were investigated, the manufacturing technology and processing conditions of which were different. The specimens were subjected to metallographic, electronic microscopic, X-ray structure and spectral analyses; their microhardness was also investigated. During some grinding conditions and other operations carried out after hardening, high temperatures and local pressures are arising, the interaction of which causes structural transformations in the surface

Card 1/2

The effect of mechanical operations ...

layer. The thermal effect during grinding is different in the field of surface projections and cavities. The projections may undergo a second hardening, while the cavities mainly experience a tempering. The non-homogeneity of the outer layer produces structural stress raisers owing to which micro-destructions are possible in the surface layer. The thermal effect arising during the process of after-hardening operations contributes to the concentration of chromium and carbon at the surface. The initial microgeometry and the shape of the surface being machined affect the temperature gradient of the outer layer. The defective layer originating during the preceding operations cannot always be eliminated by technological finishing operations. The investigation shows the way of developing dependable processing conditions. There are 21 figures.

AUTHORS: May, L., Sprogis, Yu.

TITLE: New method of producing methyl triacetoxysilane

PERIODICAL: Izvestiya Akademii nauk Latvyskoy SSR, no. 1 (162), 1961,
71-76

TEXT: All procedures hitherto used to produce methyl triacetoxysilane can be divided into three steps: 1) acetylation of alkyl chlorosilane by various acetylating agents, 2) distillation of the solvent under atmospheric pressure, and 3) vacuum distillation of alkyl acetoxysilane, possibly with the use of a dephlegmator. B. N. Dolgov, V. P. Davydova, and M. G. Voronkov consider the acetylation of alkyl chlorosilanes by acetic anhydride at room temperature during 18-20 hr, subsequent slow distillation of the acetyl chloride, and fractionation of the residue under vacuum with the use of a dephlegmator, to be the most suitable method of producing alkyl acetoxysilanes; the methyl triacetoxysilane yield attains up to 70% of the theory. K. A. Andrianov, A. A. Zhdanov, and A. A. Bogdanova obtained methyl triacetoxysilane from methyl
Card 1/5

trichloro silane and acetic anhydride by continuous distillation of the acetyl chloride by a dephlegmator and a descending cooler with a yield of 78% of the theory. The authors' experiments showed that a yield of about 70-75% of the theory can be attained with the use of all variants mentioned for the acetylation of methyl chloro silane. Benzene, toluene, carbon tetrachloride, 1,2-dichloro ethane, and ether were studied as solvents; the acetylation of methyl trichloro silane was most efficient by means of glacial acetic acid in benzene, CCl_4 , or 1,2-dichloro ethane (70-75% yield of the theory). The dependence of the boiling point of methyl triacetoxysilane on pressure in vacuum distillation was determined (Fig. 1). In the distillation (which must be repeated) under vacuum or atmospheric pressure, 1,3-dimethyl-1,1,3,3-tetraacetoxysiloxane is formed by means of intramolecular condensation, and sometimes polymerizes to a resinous substance. This also leads to reduced yields. Therefore, it is more convenient to recrystallize the product from the reaction mixture, the best solvents being the aliphatic hydrocarbons of petroleum (petroleum ether, benzine, kerosene) and, among them, benzine. Acetylation is best carried out at 66 - 67°C (boiling point of methyl trichloro silane), which guarantees

Card 2/5

New method of producing...

S/197/61/000/001/002/002
B124/B203

an efficient condensation of vapors. With the use of benzine as a solvent in the acetylation of methyl trichloro silane, the reaction mixture forms two distinctly separated layers after filtration. Crystallization begins immediately, and is concluded after 1-6 hr (depending on the volume of the crystallized fraction and the type of precipitation). Fig. 2 shows a typical crystallizate from benzine (pure liquid methyl triacetoxy silane). The formation of layers in the filtrate also occurs in kerosene, but yield and purity of the product are lower. Under optimum conditions, the yield in the procedure described attains 80-86% of the theory; it depends on the time of heating, the amount of solvent, the conditions of filtration and rewashing, the time of cooling, etc. The degree of purity of the crystalline product is 95-98%. Among all known methods, the one described is the simplest, most economical, and most suitable for application in the industry. There are 3 figures and 23 references: 5 Soviet-bloc and 16 non-Soviet-bloc.

Effect of a constant addition of β -carotene in the green fodder on the usefulness and health of chickens. Ladislav Landau and Adolf Špronc. *Pol'nohospodárstvo* 3, 61-80 (1958).—Two groups of 280 white Leghorns each were used in the expts. The first group obtained fresh green fodder from the second day after birth until the 14th month. The second group obtained the usual standard mixt. of food and had the seasonal privilege of eating outside on the green pasture. All other environmental factors were kept as equal as possible. The authors noted a distinct advantage of the first group of animals over the second group in respect to growth, weight, attainment of puberty, ability to lay eggs, capability of eggs to hatch, and health of the animals. Details are given and a very complete literature is cited.

TITLE: A direct action pressure regulator. Class 42, No. 175753 [announced by Central Engineering Bureau of Armature Construction (Tsentral'noye konstruktorskoye byuro armaturostroyeniya)] ⁴⁴

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 99

TOPIC TAGS: pressure regulator, mechanical engineering

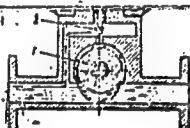

ABSTRACT: This Author Certificate presents a direct action pressure regulator containing a directing membrane mechanism with a regulating device, the regulating organ in the form of a ball valve, and a regulated throttle with a valve. ⁴⁴ The throttle is mounted in line between the chamber above the ball and a pipe behind the regulating organ. To produce a low coefficient of hydraulic resistance, the chamber above the ball is connected to the chamber of the directing mechanism, while the membrane is rigidly connected to the valve of the throttle.

TITLE: Device for the prevention of pressure increase in tanks and pipelines.
Class 47, No. 181931

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 10, 1966,
115

TOPIC TAGS: pressure control, ~~pressure~~ ^{storage} valve, pipeline, tank, ^{hydraulic} resistance

ABSTRACT: An Author Certificate has been issued for a device preventing pressure increase in tanks and pipelines. The device includes a main spring-valve and an auxiliary spring-valve. In order to increase operating reliability and reduce hydraulic resistance, both valves are spherical and mounted on the elastic walls of the chamber. The main-valve chamber cap has a port connecting it with the upper chamber of the valve housing (see Fig. 1). Orig. art. has: 1 figure. [KP]

The sulfonation of naphthalene with equimolecular amounts of sulfuric acid. A. A. SEMENOV. *J. Chem. Ind. (Moscow)* 8, No. 20, 41-5 (1931).—Vapors of pure benzene, previously refluxed with H_2SO_4 , are passed through the sulfonation mixt. during reaction to carry off the H_2O formed. From 3 to 4% unreacted H_2SO_4 should be left in the mixt. after sulfonation. The yield is 97%.

Sulfonation of naphthalene in vacuo. I. Ya. Grishin and A. A. Sorukhov. *Antimikroboynaya Prom.* 2, No. 11, 19-21(1932). An app. for the sulfonation of $C_{10}H_8$ is described. 70% of $C_{10}H_8$ is introduced into a sulfonator heated to 155° , then the whole of the 93% H_2SO_4 preheated to $70-80^\circ$, and the mass stirred for 10 min. The vessel is now gradually evacuated to 600 mm. to remove the H_2O formed, any unchanged $C_{10}H_8$ being recovered in a trap. A further 20% of the $C_{10}H_8$ is then treated in the same way and finally the remaining 10% no excess of H_2SO_4 need be employed. B. C. A.

PROCEDURES AND PROPERTIES INDEX

Determination of Impurities in commercial α -nitronaphthalene B. P. Fedorov and A. A. Spitskiy. *Analiticheskaya Prom.* 4, 100 (1931). For the detn. of water, acidity and mech. impurities, dissolve α -C₁₀H₇NO₂ in xylene or toluene and proceed as usual. For the detn. of nitronaphthols, stir 20 g. α -C₁₀H₇NO₂ with 200 cc. 1% Na₂CO₃ at 50-80° for 20 min. in *vacuo*, cool with stirring, filter from C₁₀H₇NO₂, wash, acidify the filtrate with 6-7 cc. of concd. HCl, filter through a glass filter, wash, dry and weigh. For the detn. of C₁₀H₈, stir 3 g. of C₁₀H₇NO₂ from the preceding extn. (dried at 40-50°) in a Pavlovskii app. with 11 cc. petr. ether 20 min. at 50° and 30 min. at 0°, force the soln. into the weighed connecting Erlenmeyer flask, wash the undissolved C₁₀H₇NO₂ with 4 cc. petr. ether (cooled to 0°) and transfer into an Erlenmeyer flask, expel the petr. ether with a gentle current of air (suction), weigh the flask and det. any contaminating C₁₀H₇NO₂ in the residue by the Kiehl method and C₁₀H₈ by difference. For the detn. of dimitronaphthalenes and resinous matter, stir 2 g. of C₁₀H₇NO₂ from the previous detn. of C₁₀H₈ in a Pavlovskii app. with 18 cc. petr. ether at 50° as described above, evap. the petr. ether and weigh. Because of the previous extn. of C₁₀H₈ and a little α -C₁₀H₇NO₂, the actual percentage of dimitronaphthalenes and resinous matter is somewhat lower; the difference, however, with the introduced correction is negligibly small. From the m. p. of the residual C₁₀H₇NO₂ the contents of α - and β -C₁₀H₇NO₂ are detd. according to the proposed thermal curve. A mixt. of specially prepd. α - and β -C₁₀H₇NO₂ and corresponding contaminating products analyzed by this method gave values with an accuracy of 0.1-0.2%. Chas. Blanc

Analysis of α -nitronaphthalene. B. P. Fedorov and A. A. Spitskiy. *Andinokhromskaya Prom.* 6, 627-31 (1934); ref. C-74-28, 46961. The previous method of analysis was improved. For the detn. of acidity and mech. impurities, dissolve α -C₁₀H₇NO₂ (I) in toluene or xylene and proceed as usual. For the detn. of H₂O, boil 20 g. I with 80 cc. toluene for 1 hr. in a flask connected with a graduated distn. tube provided with a reflux bulb condenser. For the detn. of C₁₀H₇, boil 20 g. I with 80 cc. H₂O and 3 cc. of 30% NaOH for 2 hrs. until 500 cc. of condensate is formed, cool, filter off C₁₀H₇, contg. about 3 g. I, weigh wet, mix with a double amt. of granulated Sn and 5 cc. of 100% AcOH, evacuate quickly, heat in a boiling water bath for 30 min., add 40 cc. H₂O and 3 cc. of concd. H₂SO₄, distil off C₁₀H₇ with steam (1-2 hrs.), cool, filter and weigh. The values obtained are uniformly 0.2% low, which must be added to the results of detn. For the detn. of nitronaphthols, digest 20 g. I with 1% NaOH on a water bath at 70-75° for 2 hrs., cool, filter off I, wash,

acidify the filtrate, filter off the nitrophenols through a Schott filter, dry and weigh. For the detn. of dinitronaphthalenes and resinous matter, use I from the previous detn., free it from C₁₀H₇ by distg. with steam for 2 hrs., filter off C₁₀H₇, contg. some I, heat in a porcelain dish on a water bath for 3 hrs. until all C₁₀H₇ is evapd., unite the I with the main portion, dry, weigh about 2 g. of this, work up in the Pavlovskii app. with 18 cc. of petr. ether (b. 70°) at 50° for 30 min., filter, wash with petr. ether, expel the petr. ether with air at 40° and weigh. The loss in wt. gives dinitronaphthalenes and resinous matter. The residue is freed from the last traces of resinous matter by boiling in toluene with pure animal charcoal, and from the m. p. of the dried product the contents of α - and β -C₁₀H₇NO₂ are detd. according to the proposed thermal curve. A method of spectrophotometric detn. of α - and β -C₁₀H₇NO₂ in concd. H₂SO₄ solns. is described. C. B.

Color reactions and spectrophotometric determination of nitronaphthalene. B. P. Fedorov and A. A. Serulskiy. Z. anal. Chem. 101, 188-191 (1935); J. Gen. Chem. (U. S. S. R.) 5, 450 (3); cf. C. A. 29, 2480. A spectrophotometric method for analyzing a mixt. of α and β nitronaphthalene is described which is based on the color produced by treatment with 93.8% H_2SO_4 . The red color of the soln. of α -nitronaphthalene in concd. H_2SO_4 fades away when a little of any org. solvent of the nitro product is added, such as Ac_2O , $AcOH$, tetralin, etc. The color reactions of the mono- and di-nitronaphthalene in solns. of concd. H_2SO_4 as well as in the presence of alkali hydroxide in acetone and pyridine are described. Tech. nitronaphthalene was found to contain 1 part of the β -isomer to 17.87 of the α -isomer. W. T. H.

Sulfonation of naphthalene. H. P. Ebdon and A. Spenshaw. *Org. Chem. Ind. (U. S. S. R.)* 2, 100 (1930); cf. *C. A.* 26, 4589. Raps. on the sulfonation of $C_{10}H_8$ and hydrolysis of $C_{10}H_7SO_3H$ with H_2O and dil. H_2SO_4 show that the sulfonation process is a more complex reaction than is conceived by Martinson and Ioffe (*C. A.* 26, 2254). The equil. const. depends not only on the rate of sulfonation of $C_{10}H_8$ and the hydrolysis of the $C_{10}H_7SO_3H$ ($C_{10}H_8 + H_2SO_4 \rightleftharpoons C_{10}H_7SO_3H + H_2O$), but also on the state of equil. of H_2SO_4 with its hydrates: $H_2SO_4 + nH_2O \rightleftharpoons H_2SO_4 \cdot nH_2O$. The sulfonation equil. can be shifted to a min. concn. of 60-2% H_2SO_4 . While κ of sulfonation (Gayot, *C. A.* 16, 404; Courtot, *C. A.* 24, 2430) is an indefinite value, it constitutes that concn. of H_2SO_4 which asymptotically approaches the limit when the sulfonation practically stops. Hence the conception of κ of sulfonation is important in the calcus. of amts. of H_2SO_4 required for the sulfonation of org. compds. (cf. Voroshinov, Jr., *C. A.* 26, 4632).

Chas. Blanc.

Production of β -naphthol. R. K. Kikhman and M. Ya. Il'yukovich. *Org. Chem. Ind. (U. S. S. R.)* 1, 722.8 (1930); cf. *C. A.* 26, 4081; 30, 5213. The moisture content of β - $C_{10}H_7SO_3Na$ is reduced from 30% to 18-25% by the reversed procedure of introducing Na_2CO_3 or Na_2SO_4 into the sulfonation product. Various methods of alk fusion and distn. of β - $C_{10}H_7OH$ are discussed. C. B.

Isomeric xylydines: diazotization, decomposition of diazonium compounds and coupling with *p*-nitrophenyldiazonium. V. B. P. Fedorov, A. A. Spryskov and E. I. Sheludyakova. *J. Gen. Chem. (U. S. S. R.)* 8, 814 (1938); cf. *C. A.* 32, 2001^a. - The velocities of the reactions of formation and decomn. of diazonium compds. of isomeric xylydines were measured by a colorimetric method. To this end, aliquot parts of the diazo compd. (formed in the reaction or remaining unaltered during the decomn.) in the reaction mixt. were coupled with 2,0-HOC₆H₄SO₃H (Schaeffer's acid) at definite intervals and the color intensities were compared with that of standard solns. similarly treated. The tests were made with pure products. In the following the 1st of each set of 2 nos. (times 10⁻⁶) represents the velocity const. of diazotization at 0° and the 2nd no. represents the velocity const. of decomn. of the diazonium compd. of the xylydine isomer at 40°: *m*-4, 2.070, 7.02; *o*-4, 2.123, 13.79; *m*-2 (not detd.), 375.7; *p*, 4.045, 419.4. Preliminary results show that *p*-O₂NC₆H₄N₂Cl in strong HCl soln. at 18° couples with *m*-2- and *p*-xylydine and does not couple with the *m*-4- and *o*-4-isomers. Chas. Blanc

The sulfonation reaction. 1. Mechanism of the process of monosulfonation. A. A. Gerasimov, *Chem. Rev.* 1957, 37, 1837 (Russian); French, 1958, 1965. The sulfonation of aromatic hydrocarbons (naphthalene, benzene, toluene), $H_2SO_4 + RH \rightleftharpoons RSO_3H + H_2O$, is an equil. reaction, proceeding concurrently with the equil. hydration reactions $H_2SO_4 + H_2O \rightleftharpoons H_2SO_3 + H_2O$ and $RSO_3H + H_2O \rightleftharpoons RSO_3H + H_2O$. Decrease in the amt. of H_2O , either added or formed, increases the soly. of RH (when present in sufficient excess) in the sulfonation mixt. and shifts the equil. in the direction of forming the sulfonic acid (1). Increase in the amt. of H_2O bound by H_2SO_4 also favors sulfonation. By decreasing the amt. of H_2O in the reaction mixt. and using a large excess of H_2SO_4 , the limiting effective concn. of the spent acid may be lowered from about 60% to 43.6% (at 100°).

Influence of time and excess of the sulfonation reagent on the process of reaction. A. A. Spryskov. <i>J. Gen. Chem.</i> (U.S.S.R.) 14, 813-41 (1944) (English summary); cf. <i>C.A.</i> 33, 5820^a.—The monosulfonation mechanism of naphthalene proposed previously by S. was confirmed by exptl. data. Increase of the excess of the substance being sulfonated slows down the sulfonation rate (if the substance is in-sol. in H_2SO_4). After 30 hrs. of sulfonation of $C_{10}H_8$ by an equimol. amt. of 100% H_2SO_4 at 162° a condition is reached which is near equil.; the latter is established when the concn. of spent acid reaches 40%. At low temps. as well as with a large excess of $C_{10}H_8$ very long periods of time are needed for attainment of equil. Thus, with 3 mols. $C_{10}H_8$ and 1 mol. H_2SO_4 equil. was not reached although the spent acid concn. dropped to 25% in 30 hrs. at 162°. In view of the dependence of the concn. of the spent acid not only on the temp. and the substance being sulfonated, but also on the concn. of H_2SO_4 being used, the excess of substance being sulfonated, and the duration, the concept of Guyot (<i>C.A.</i> 16, 404) has no significance. The 25% concn. of spent acid reached in the sulfonation of $C_{10}H_8$ in this work is, apparently, not the limiting min. concn. G. M. Kosolapoff</p> </div>

III. Conversion of 1-naphthalenesulfonic acid into the 2-isomer. A. A. Stryakov and N. A. Ovsyankina (Ivanovsk State Mech. Inst.). <i>J. Gen. Chem. (U.S.S.R.)</i> 16, 1057-9 (1940) (in Russian); cf. <i>C.A.</i> 60, 1821⁹.—The time factor of conversion of 1-C₁₀H₇SO₃H (I) into the 2-isomer (II) was studied at 160-2°; the equil. between I and II is established under these conditions in 1-1.5 hrs. at the ratio of 15:85 of the 2 isomers. The heating was done in the presence of H₂SO₄, H₂O and of other concns. of H₂SO₄, down to 36% H₂SO₄. It was shown that 57% H₂SO₄ leads to establishment of equil. more rapidly than does the 36% acid; this arises from hydrolysis of the C₁₀H₇SO₃H by the stronger acid, with formation of C₁₀H₈ and H₂SO₄, and the latter then sulfonates C₁₀H₈ in the 15:85 isomer ratio. IV. A method of sulfonation of naphthalene. A. A. Stryakov. <i>Ibid.</i> 1000-4.—A new method for the sulfonation of C₁₀H₈ was developed which consists in the addn. of 1 mole 100% H₂SO₄ to 1.7 moles C₁₀H₈ at 85°, and heating the mixt. 2 hrs. to 163°. The final mixt. contains 5% unreacted H₂SO₄ and 2-2.5% sulfones and tars. The excess C₁₀H₈ is recovered by diln. of the mass with water above 80°. The sulfonated product contains 86.2% II. G. M. The sulfonation reaction. V. Conditions of irreversibility of the sulfonation reaction. A. A. Spreyskov (Ivanovsk State Med. Inst.). *J. Gen. Chem. (U.S.S.R.)* 16, 2120-31 (1946) (in Russian); cf. *C.A.* 41, 27206d. Attempts were made to reach equil. starting with each of the sulfonation products, 1- and 2-naphthalenesulfonic acids, in the form of monohydrates. Samples of 0.3-0.6 g. were heated in sealed tubes to 100° and the mixts. were titrated with 0.1 N NaOH. The 1-isomer gave the following results: 6 hrs., 13.2% hydrolysis, final H_2SO_4 concn. 43.2%; 12, 23.7, 60.5; 19, 23.6, 60.3; 24, 21.8, 57.5; 50, 18.6, 52.3; 75, 17.5, 51.0. The 2-isomer, however, failed to show hydrolysis even after 130 hrs. at 100°; the same result was obtained after heating the acid 127 hrs. with 0.4 mol. HCl and 2.6 mols. H_2O . The decrease of % hydrolysis of the 1-isomer after 12 hrs. is obviously due to reversal of the hydrolysis by sulfonation with H_2SO_4 of over 60% concn. which yields both 1- and 2-isomers; it is probable that given a sufficient time all of the material would be transformed into the 2-isomer, which is stable to hydrolysis. Further, $C_{10}H_7$ was sulfonated in sealed tubes: the 2-isomer was detd. by either salting out or by the $PhNH_2$ method. Generally the mixts. were originally heterogeneous, slowly becoming homogeneous, the more rapidly when the amt. of disulfonic acids was small; a considerable amt. of disulfonation took place during the charging of the tubes when stirring was excluded. In 1 expt. the mixt. was stirred immediately

on mixing before sealing; in this case the mixt. was homogeneous within 1 hr. of heating with const. shaking. All expts. were conducted at 100°; $C_{10}H_7:H_2SO_4 = 1$; H_2SO_4 concn. = 100%; duration of reaction 400 hrs.; complete soln. 120 hrs.; appearance of solid 2- $C_{10}H_7SO_3H$ 240 hrs.; sulfones and tars 0.02%; disulfonic acids 16.7%; 2-isomer 80.4%; 1-isomer 13.6%; residual H_2SO_4 6.8% of original. (Figures given below are in the above order): 1, 100, 600, 25, 240, 0.81, 4.5, 0.4, 5.6, 1.1; 1, 100, 1000, 75, 340, 0.96, 8.3, 95.3, 4.7, 2.8; 1, 100, 1364, —, — (heated to 163° for 4 hrs., mass no longer melted at 100°), 2.00, 3.5, 96.8, 3.4, 1.0; 1.08, 100, 1411, 1, 250, 1.06, 1.8, 97.8, 2.2, 0.5; 1.5, 100, 400, insol., 290, 1.5, 12.7, 81.8, 18.2, 0.4; 1.5, 100, 600, 50, 389, 1.32, 2.5, 87.7, 12.3, 4.9; 1.5, 100, 1000, 720, 290, 1.61, 11.3, 87.5, 12.5, 3.7; 1, 92.75, 400, insol., 290, 0.66, 17.2, 80.7, 19.3, 15.9; 1, 92.75, 600, 410, does not appear, 0.62, 14.8, 83.9, 16.1, 14.1; 1, 92.75, 1000, 340, 290, 0.66, 11.4, 87.7, 12.3, 12.2. Besides showing the gradual transformation of the originally formed 1-isomer into the 2-isomer, the expts. show that sulfonation of $C_{10}H_7$ at 100° is essentially irreversible (in the 1411-hr. expt. only 0.5% of original H_2SO_4 remained unreacted). In sulfonations involving the formation of only 1 isomer there exists a temp. below which the sulfonic acid does not hydrolyze and the reaction is irreversible. In cases of 2-isomer formation, there are 2 temps. of interest: that below the hydrolysis of either isomer and that above which both isomers can be hydrolyzed. In the case of $C_{10}H_7$ these are approx. 70° and 113-15°.

G. M. Kosolapoff

"Study of Sulfonation Reaction. V. Conditions for the Irreversibility of the Sulfonation Reaction." by A. A. Goryskov (p. 2126)

in: Journal of General Chemistry (Zhurnal Obshchey Khimii) 1946, Volume 16, No. 12

Two methods for determining 1,8- and 1,3-dinitro-naphthalenes. H. P. Frohauy, A. A. Baryshov, and A. P. Brinolina. *Zavodskaya Lab.* 13, 120-3 (1947).—(1) Reduction method. Mix 0.3 g. of sample with 1.5 g. of Zn dust in a flask, add a mixt. of 10 ml. of 80% AcOH and 5 ml. concd. HCl, and attach an air-cooled condenser. Heat to a gentle boil with shaking for 5-6 min., add 50 ml. more of concd. HCl, stir, and heat to dissolve all Zn. Cool and, after about 1 hr., filter off the hydrochloride of 1,5-naphthylendiamine. Wash with concd. HCl and dry to const. wt. at 85°. If a little of the 1,6-isomer is present (20-25%), then before filtering, add 80 ml. HCl, keep in ice water for 3-4 hrs., and shake periodically until all Zn dissolves. The percentage of 1,5-dinitronaphthalene = $91.4 (a/e)$ where a is the wt. of the ppt. of hydrochloride of 1,5-naphthylendiamine and e is the wt. of a mixt. of dinitronaphthalenes. (2) Sulfite method. Moisten the sample with 1 ml. alc., add 4-5 mols. of NaHSO₃ in 1-3% aq. soln., mix with a stirrer (about 20 r.p.m.), and heat for 1-2 hrs. at 80°. Neutralize the diked. Na bisulfite soln. to phenolphthalein, cool, filter the remaining 1,5-dinitronaphthalene, wash with water, dry at 80-85° and weigh. The results for the 1,6 isomer in the mixt. are always higher by 1-2% so that a const. correction must be made. It was also found that the action of 1% aq. soln. of NaHSO₃ at 80° for 1 hr. upon 1,4,6- and 1,3,8-trinitronaphthalenes and 1,3-dinitronaphthalene causes the trinitronaphthalenes to go into soln. whereas some 1,3-dinitronaphthalene does.

Sulfonation reaction. VII. Equilibrium between 1- and 2-naphthalenesulfonic acids. A. A. Spryskov (Ivanovsk State Med. Inst.). *J. Gen. Chem.* (U.S.S.R.) 17, 1309-15 (1947) (in Russian); cf. *ibid.* 17, 591; *C.A.* 42, 894A. Sulfonation of $C_{10}H_8$ by an equimol. amt. of 100% H_2SO_4 in sealed tubes at 122° leads to equil. between the 1- and 2-sulfo isomers only very slowly and only after some 500 hrs. does a real approach to equil. take place. The equil. ratio at 122° is 1:2-isomer = 4:96. At 140° the equil. is reached fairly rapidly (about 32 hrs.) when the above ratio is 9:91; with 1.16 moles of $C_{10}H_8$, the amt. of 1-sulfo isomer drops to 6.5%, but with less than 1 mole $C_{10}H_8$, the 1-isomer increases to 19% (the phenomenon is as yet unexplained). At 163° 4 hrs. suffice for equil.; here, if the residual H_2SO_4 concn. drops to 43%, the 1-sulfo isomer at equil. is only 6.5% of the total; when the H_2SO_4 concn. drops only to 57% this isomer is found in 18.5% concn. G. M. Kosolapoff

<p>The sulfonation reaction. VIII. Heat effect of sulfonation of naphthalene. A. A. Spryskov. <i>Zhur. Obshch. Khim.</i> (J. Gen. Chem.) 18, 98-102(1948); cf. C.A. 42, 1921c; 43, 471c. Calorimetric study of sulfonation of $C_{10}H_8$ with 100% H_2SO_4 at 16-20° (predominant formation of 1-isomer) has shown the heat effect is 5.07 kcal./mole (calcd. on liquid starting materials). The heat of soln. of the anhyd. 1-sulfonic acid in water is 8.3° is 6.06 kcal./mole; that of the hydrate is 0.30 kcal./mole; hence the heat of hydration of the 1-sulfonic acid is 5.7 kcal./mole. Calcn. of the heat effect in various stages of the sulfonation shows that as the reaction proceeds to completion, it is accompanied by a smaller heat effect (per mole $C_{10}H_8$). IX. A method of preparation of 2-naphthalenesulfonic acid under pressure. <i>Ibid.</i> 749-52; cf. C.A. 41, 272M. $C_{10}H_8$ is treated with $H_2SO_4 \cdot H_2O$ at 80-90° and heated 4 hrs. at 103° in a closed vessel at 2 atm. pressure. This procedure gives a low content of 1-isomer (6%) and a high utilization of H_2SO_4 (unused acid is but 4-5%); the 2-isomer is obtained in 92.2-94.4% yield. Unreacted $C_{10}H_8$ ranges from 1.4 to 22.7% when 1.000-1.155 mol. $C_{10}H_8$ is used per mole of H_2SO_4. The analytical method used was described earlier (S., C.A. 40, 18217). X. Polysulfonation of naphthalene. <i>Ibid.</i> 941-7; cf. Dubnikov and Zorin, C.A. 42, 81c.—The degree of sulfonation of $C_{10}H_8$ was investigated under a variety of conditions. At 100° disulfonation is irreversible, while at 103° it is reversible and is an equil. reaction. It was found that polysulfonation is possible with relatively weak acid. Thus the following concns. of spent acid were found: for disulfonation at 2-25° 87%, at 101° 50%, at 103° 80%; for trisulfonation at 103° 77%. Samples of $C_{10}H_8$ were heated with 0.8-3 g. H_2SO_4 in sealed tubes, after which the sulfonic acids were titrated, with the assumption that in cases where less than 2 moles H_2SO_4 had reacted per mole of $C_{10}H_8$, the mixt. contained only mono- and disulfonic acids, etc. This is confirmed by the expt. in which a 3-1 molar ratio gave 95% di- and 5% trisulfonates. Only in very long expts. were insol. products</p>

detected. The following results were obtained with 100% H_2SO_4 : at 20° 0.18 mole $C_{10}H_8$ per mole H_2SO_4 in 0.25 hr. gave 84% mono- and 16% disulfonic acids; 0.1 mole $C_{10}H_8$ per mole H_2SO_4 in 1.5 hrs. gave 86 and 14%, resp.; 0.37 mole in 11.240 hrs. at 5-25° gave 78 and 22%, resp.; while 0.12 mole under the same conditions gave 98% di- and 2% trisulfonic acids. At 100° the results were: 0.03 mole $C_{10}H_8$ per mole H_2SO_4 in 40 hrs. gave 90% di- and 10% trisulfonates, spent acid concn. 98.7%; 0.10 mole in 165 hrs. gave 90 and 10%, resp., 94.8% spent acid; 0.42 mole in 40 hrs. gave 54% mono- and 46% disulfonates, 76.9% spent acid; 0.5 mole in 24 hrs. gave 75% mono- and 25% diacid, spent acid 76.5%, while in 1570 hrs. this gave 43% mono- and 57% disulfonic acid, with 59% spent acid concn. At 130° the results were: 0.5 mole $C_{10}H_8$ in 1 hr. gave 80% mono- and 20% disulfonic acids, 78% spent acid; in 3 hrs. 78% and 22%, resp., and 77.7% spent acid; in 6 hrs. 71% mono- and 29% disulfonates, 75.3% spent acid; 0.2 mole $C_{10}H_8$ in 3 hrs. gave 98% di- and 2% trisulfonic acids, with spent acid of 80.1% concn., while 0.25 mole in 3 hrs. gave 5% mono- and 95% disulfonic acids, with 85.3% spent acid. At 163° 0.10 mole $C_{10}H_8$ per mole H_2SO_4 in expts. ranging up to 36 hrs. gave a max. of 65% tri- and 35% disulfonation (at 36 hrs.), with 93.6% spent acid; 0.20 mole $C_{10}H_8$ in expts. up to 210 hrs. gave a max. of 29% tri- and 71% disulfonation at 210 hrs., with 86.5% spent acid concn.;

with 0.3 mole $C_{10}H_8$ (up to 210 hrs.), the 22-hr. run gave 64% mono- and 36% disulfonation (62.6% spent acid) when 78.3% H_2SO_4 was used, while the 100% acid gave in 47 hrs. 1% mono- and 99% disulfonates, with 78.6% spent acid concn., and at 210 hrs. 95% di- and 5% trisulfonates were obtained (spent acid, 77.4%); when 0.45 mole $C_{10}H_8$ was used the max. values were at 210 hrs. 23% mono- and 77% disulfonates, with 57.8% spent acid; further increase of the amt. of $C_{10}H_8$ lead to the progressively larger amts. of monosulfonates. Heating 0.2534 g. 2,6-disulfonyl chloride with 0.1320 g. H_2O 100 hrs. at 163° gave 12.2% hydrolysis of the sulfo group (estd. by SO_2 detn.), while in a similar expt. the 2,7-isomer gave 10.8% hydrolysis; this shows that disulfonation is no longer reversible at this temp. Sulfonation of 1- and 2-sulfonaphthalenes at 100° with 0.18-0.4 mole per mole H_2SO_4 for 15-1227 hrs. showed that 95% H_2SO_4 is capable of introducing a 3rd sulfo group into the mol.; thus, the spent acid concn. was 95%, when 0.18 mole 1- $C_{10}H_7SO_3H$ and 1 mole 100% H_2SO_4 were kept at 100° 167 hrs., resulting in formation of 78% di- and 22% trisulfonic acids; with the 2-isomer, using 0.21 mole with 88.6% H_2SO_4 , 15 hrs. gave 3.6% mono- and 96.4% disulfonates, with spent acid concn. of 82.7%.
